APS Filesystem Service Provider

User Guide

1.0.0

Tommy Svensson

APSFilesystemService

This provides a filesystem for writing and reading files. This filesystem resides outside of the OSGi server and is for longterm storage, which differs from BundleContext.getDataFile() which resides within bundle deployment. The APSFilesystemService also does not return a File object! It priovides a file area for each unique owner name that is accessed through an API that cannot navigate nor access any files outside of this area. The ”owner” name should be either an application name or a bundle name if it is only used by one bundle.

The APSConfigService uses the APSFilesystemService to store its configurations.

Setup

The *aps.filesystem.root* system property must be set to point to a root where this service provides its file areas. This is either passed to the JVM at server startup or configured withing the server. Glassfish allows you to configure properties within its admin gui. Virgo does not. If this is not provided the service will use BundleContext.getDataFile(".") as the root, which will work for testing and playing around, but should not be used for more serious purposes since this is not a path with a long term availability.

The service

The service allows you to create or get an APSFilesystem object. From that object you can create/read/delete directories (represented by APSDirectory) and files (represented by APSFile). You can get readers, writers, input streams and output streams from files. All paths are relative to the file area represented by the APSFilesystem object.

The javadoc for the APSFilesystemService.

The APIs for this service

public *interface* **APSFile** [se.natusoft.osgi.aps.api.core.filesystem.model] {

This represents a file in an *APSFilesystemService* provided filesystem. It provides most of the API of *java.io.File* but is not a *java.io.File*! It never discloses the full path in the host filesystem, only paths relative to its *APSFilesystem* root.

Use the createInputStream/OutputStream/Reader/Writer to read and write the file.

InputStream createInputStream() throws IOException

Creates a new *InputStream* to this file.

Throws

IOException- on failure

OutputStream createOutputStream() throws IOException

Creates a new *OutputStream* to this file.

Throws

IOException- on failure

Reader createReader() throws IOException

Creates a new *Reader* to this file.

Throws

IOException- on failure

Writer createWriter() throws IOException

Creates a new *Writer* to this file.

Throws

IOException- on failure

Properties loadProperties() throws IOException

If this file denotes a properties file it is loaded and returned.

Throws

IOException- on failure or if it is not a properties file.

void saveProperties(Properties properties) throws IOException

If this file denotes a properties file it is written with the specified properties.

Parameters

properties- The properties to save.

Throws

IOException- on failure or if it is not a properties file.

APSDirectory toDirectory()

If this *APSFile* represents a directory an *APSDirectory* instance will be returned. Otherwise *null* will be returned.

APSFile getAbsoluteFile()

See

java.io.File.getAbsoluteFile()

String getAbsolutePath()

Returns the absolute path relative to filesystem root.

APSFile getCanonicalFile() throws IOException

See

java.io.File.getCanonicalFile()

String getCanonicalPath() throws IOException

See

java.io.File.getCanonicalPath()

String getParent()

See

java.io.File.getParent()

APSDirectory getParentFile()

See

java.io.File.getParentFile()

String getPath()

See

java.io.File.getPath()

boolean renameTo(APSFile dest)

See

java.io.File.renameTo(File)

String getName()

See

java.io.File.getName()

boolean canRead()

See

java.io.File.canRead()

boolean canWrite()

See

java.io.File.canWrite()

boolean exists()

See

java.io.File.exists()

boolean exists(String name)

Checks if the named file/directory exists.

Returns

true or false.

Parameters

name- The name to check.

boolean existsAndNotEmpty(String name)

Checks if the named file exists and is not empty.

Returns

true or false.

Parameters

name- The name of the file to check.

boolean isDirectory()

See

java.io.File.isDirectory()

boolean isFile()

See

java.io.File.isFile()

boolean isHidden()

See

java.io.File.isHidden()

long lastModified()

See

java.io.File.lastModified()

long length()

See

java.io.File.length()

boolean createNewFile() throws IOException

See

java.io.File.createNewFile()

boolean delete()

See

java.io.File.delete()

void deleteOnExit()

See

java.io.File.deleteOnExit()

String toString()

Returns a string representation of this *APSFile*.

File toFile()

This API tries to hide the real path and don't allow access outside of its root, but sometimes you just need the real path to pass on to other code requiring it. This provides that. Use it only when needed!

Returns

A File object representing the real/full path to this file.

}

---

public *interface* **APSFilesystem** [se.natusoft.osgi.aps.api.core.filesystem.model] {

This represents an *APSFilesystemService* filesystem.

APSDirectory getDirectory(String path) throws IOException

Returns a folder at the specified path.

Parameters

path- The path of the folder to get.

Throws

IOException- on any failure, specifically if the specified path is not a folder or doesn't exist.

APSFile getFile(String path)

Returns the file or folder of the specified path.

Parameters

path- The path of the file.

APSDirectory getRootDirectory()

Returns the root directory.

}

---

public *interface* **APSDirectory** extends APSFile [se.natusoft.osgi.aps.api.core.filesystem.model] {

This represents a directory in an *APSFilesystem*.

Use this to create or get directories and files and list contents of directories.

Personal comment: I do prefer the term "folder" over "directory" since I think that is less ambiguous, but since Java uses the term "directory" I decided to stick with that name.

APSDirectory createDir(String name) throws IOException

Returns a newly created directory with the specified name.

Parameters

name- The name of the directory to create.

Throws

IOException- on any failure.

APSDirectory createDir(String name, String duplicateMessage) throws IOException

Returns a newly created directory with the specified name.

Parameters

name- The name of the directory to create.

duplicateMessage- The exception messaging if directory already exists.

Throws

IOException- on any failure.

APSFile createFile(String name) throws IOException

Creates a new file in the directory represented by the current *APSDirectory*.

Parameters

name- The name of the file to create.

Throws

IOException- on failure.

APSDirectory getDir(String dirname) throws FileNotFoundException

Returns the specified directory.

Parameters

dirname- The name of the directory to enter.

Throws

FileNotFoundException- on failure

APSFile getFile(String name)

Returns the named file in this directory.

Parameters

name- The name of the file to get.

void recursiveDelete() throws IOException

Performs a recursive delete of the directory represented by this *APSDirectory* and all subdirectories and files.

Throws

IOException- on any failure.

String[] list()

See

java.io.File.list()

APSFile[] listFiles()

See

java.io.File.listFiles()

}

---

public *interface* **APSFilesystemService** [se.natusoft.osgi.aps.api.core.filesystem.service] {

This provides a filesystem for use by services/applications. Each filesystem has its own root that cannot be navigated outside of.

Services or application using this should do something like this in their activators:

```
APSFilesystemService fss;
APSFilesystem fs;

fss.getFilesystem("my.file.system", (result) -> {
    if (result.success()) {
        fs = result.result();
    }
});
```

void getFilesystem(String owner, APSHandler<APSResult<APSFilesystem>> handler)

Returns the filesystem for the specified owner. If the filesystem does not exist it is created.

Parameters

owner- The owner of the filesystem or rather a unique identifier of it.

handler- Called with the filesystem.

Throws

APSIOException- on failure.

void deleteFilesystem(String owner, APSHandler<APSResult<Void>> handler)

Removes the filesystem and all files in it.

Parameters

owner- The owner of the filesystem to delete.

Throws

APSIOException- on any failure.

}
