1 APSStreamedJSONRPCProtocolProvider

This provides JSONRPC protocol. It provides both version 1.0 and 2.0 of the protocol. It requires a transport that uses it and services provided by aps-external-protocol-extender to be useful.

JSONRPC version 1.0 protocol as described at <http://json-rpc.org/wiki/specification>.

JSONRPC version 2.0 protocol as described at <http://jsonrpc.org/spec.html>.

JSONHTTP version 1.0 which is not any standard protocol at all. It requires both service name and method name on the url, and in case of HTTP GET or DELETE also arguments as ?params=arg:...:arg where values are strings or primitives. For POST, and PUT a JSON array of values need to be written on the stream.

JSONREST version 1.0 extending JSONHTTP will make the http transport always map methods annotated with @RESTGET, @RESTPUT, @RESTPOST, and @RESTDELETE to the corresponding http methods. This also does not require a method to be specified on the URL, and will ignore any specified method.

Personally I think that JSONRPC 2.0 is far more flexible than REST.

1.1 Examples

Here is some examples calling services over http with different protocols using curl (*requires aps-ext-protocol-http-transport-provider.jar and the called services to be deployed, and specified as externalizable via configuration (Network/service/external-protocol-extender)*):

```
curl --data '{"jsonrpc": "2.0", "method": "getPlatformDescription", "params": [],
"id": 1}'
http://localhost:8080/apsrpc/JSONRPC/2.0/se.natusoft.osgi.aps.api.core.platform.service.
APSPPlatformService
```

yields:

```
{ "id": 1, "result": { "description": "My personal development environment.", "type":
"Development", "identifier": "MyDev" }, "jsonrpc": "2.0" }
```

while

```
curl --get
http://localhost:8080/apsrpc/JSONHTTP/1.0/se.natusoft.osgi.aps.api.core.platform.service.
APSPPlatformService/getPlatformDescription
```

yields

```
{ "description": "My personal development environment.", "type": "Development",
"identifier": "MyDev" }
```

and

```
curl --get
http://localhost:8080/apsrpc/JSONHTTP/1.0/se.natusoft.osgi.aps.api.misc.session.APSSessi
onService/createSession\(Integer\)?params=5
```

yields

```
{ "id": "6d25d646-11fc-44c3-b74d-29b3d5c94920", "valid": true }
```

In this case we didn't just use `createSession` as method name, but `createSession(Integer)` though with parentheses escaped to not confuse the shell. This is because there is 2 variants of `createSession`: `createSession(String, Integer)` and `createSession(Integer)`. If we don't specify clearly we might get the wrong one and in this case that happens and will fail due to missing second parameter. Also note the `params=5`. On get we cannot pass any data on the stream to the service, we can only pass parameters on the URL which is done by specifying url parameter `params` with a colon (:) separated list of parameters as value. In this case only String and primitives are supported for parameters.

These examples only works if you have disabled the `requireAuthentication` configuration (network/rpc-http-transport).
